DEPRESSIFY · SMALL STEP

Patient app and Clinician dashboard

Every screen and state, including the Gemini Live voice Check-in. Synthetic data; no live services.

48 patient screens · 24 dashboard screens · 13 November 2026

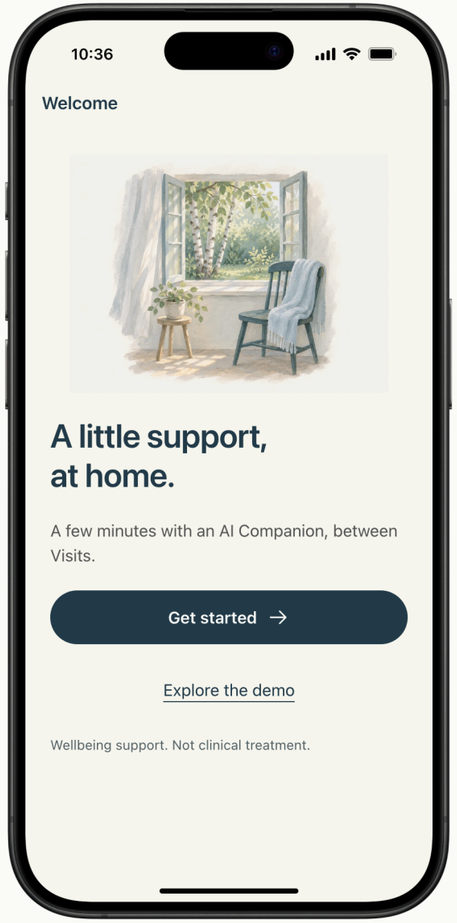
PART 1

Patient app

iPhone 393 × 852. One main action per screen. Patients never see Attention flags or scores.

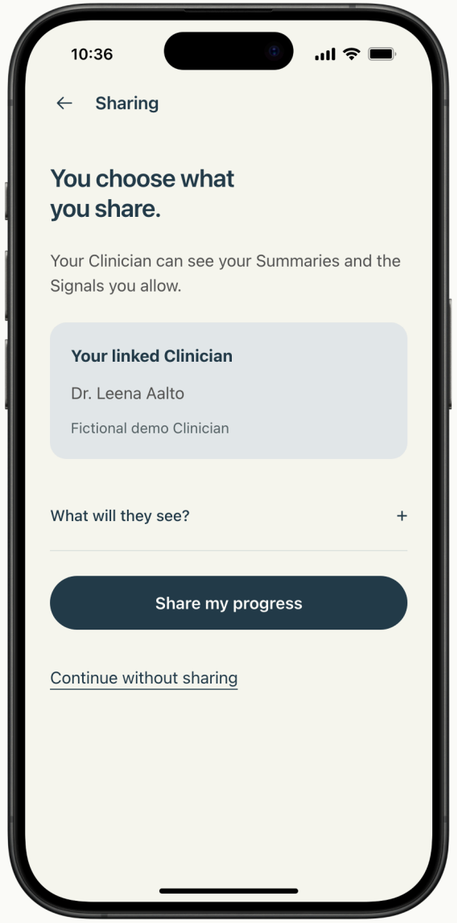
First use

One plain promise, then a real choice about sharing. Declining never blocks the app.



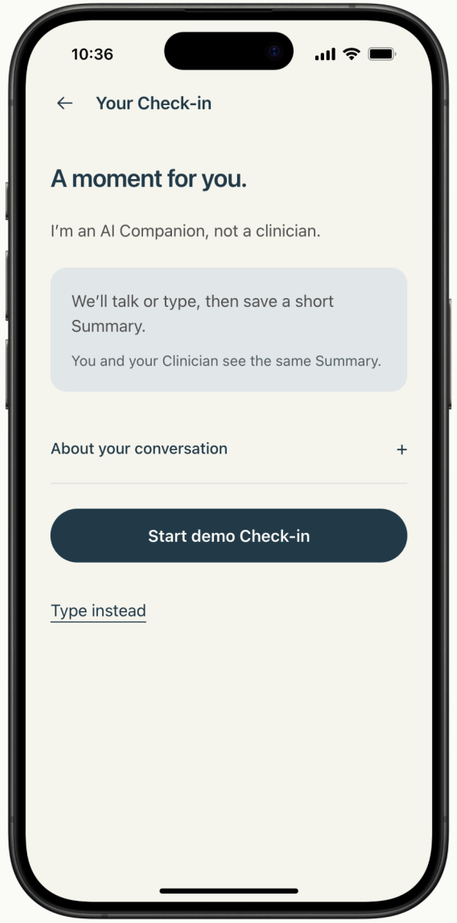
Welcome

Wellbeing support, not treatment.



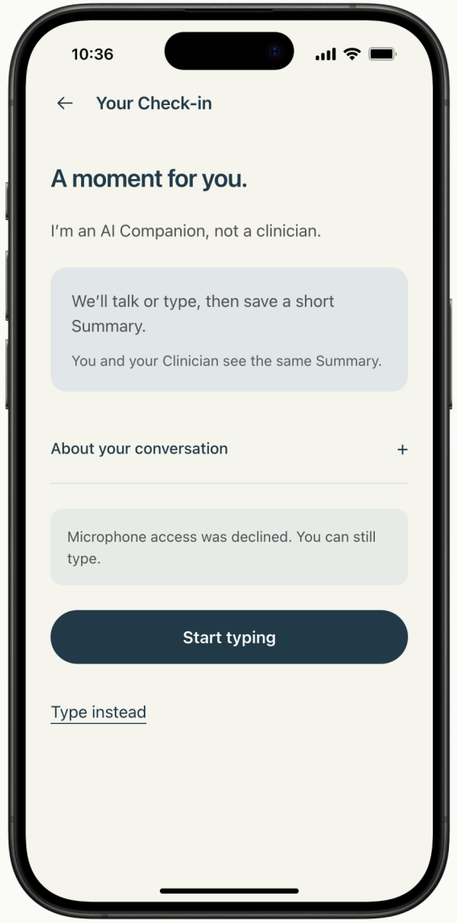
Sharing choice

Continue without sharing is equal weight.



Before the first Check-in

AI disclosure and what happens to the conversation.

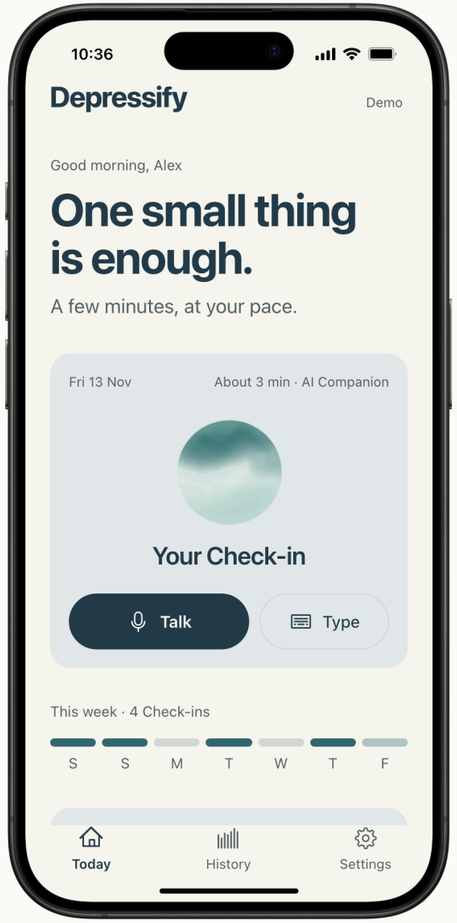


Microphone declined

Typing is offered at once.

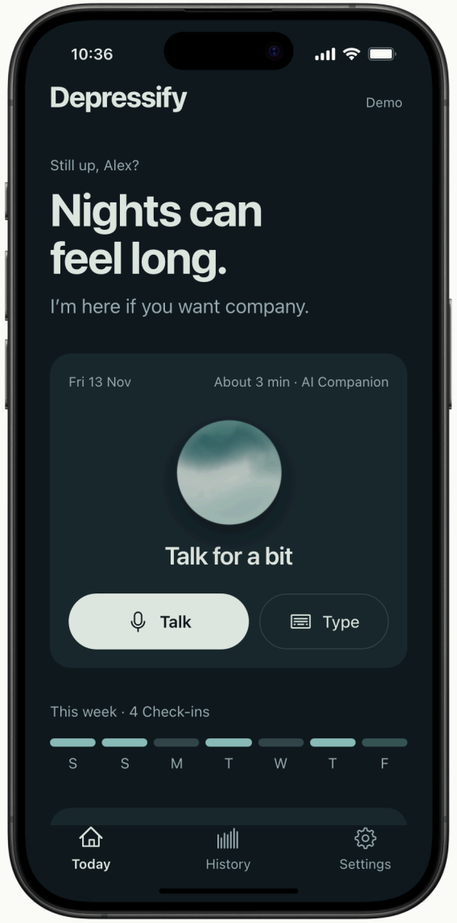
Today

One invitation. The greeting follows the time of day; after 22:00 the app turns dark and softer.



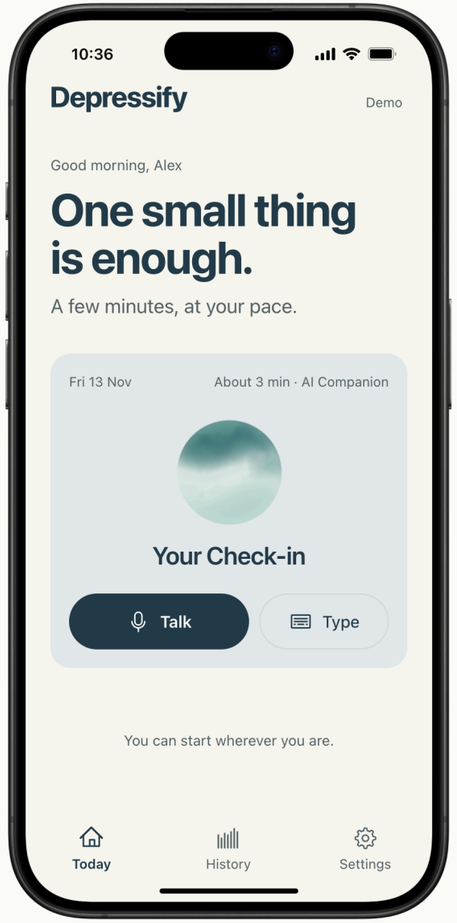
Today · morning

Check-in card with Talk and Type, then the week.



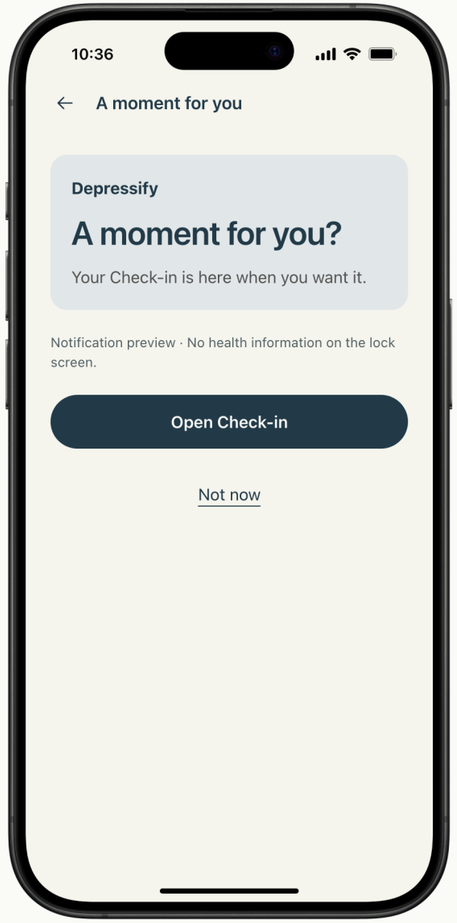
Today · 02:00

Night theme, gentler words.



No history yet

No empty dashboard, just a start.

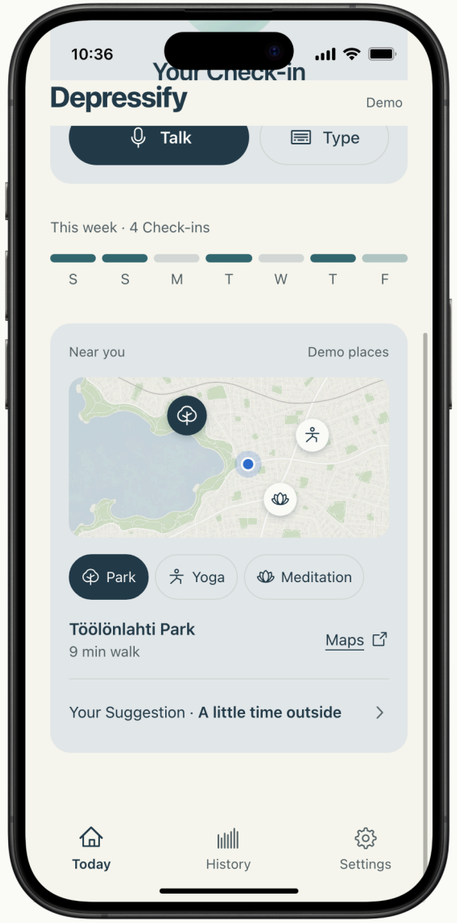


Nudge

At most once a day; nothing private on the lock screen.

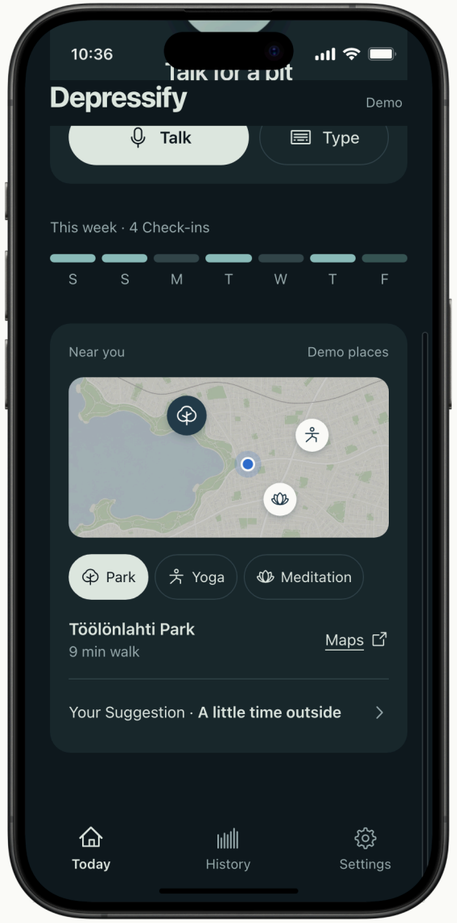
Progress and places

What was done is counted; nothing is marked as missed. Places for a next small step sit on a map.



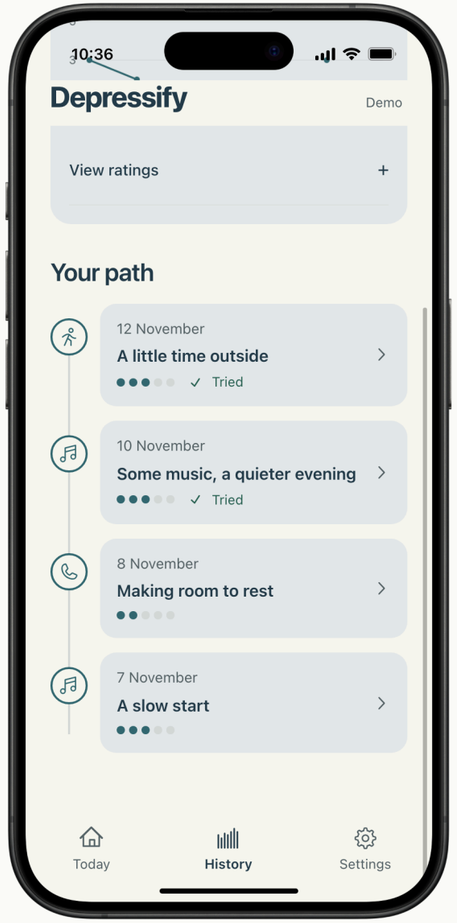
Places near you

Park, yoga and meditation, one tap to Google Maps.



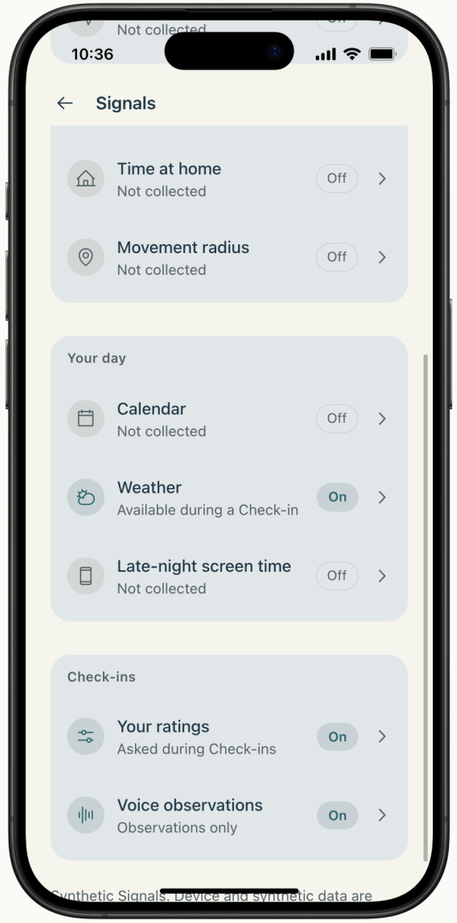
Places at night

The same card in the night theme.



Your path

Check-ins as steps on one line.

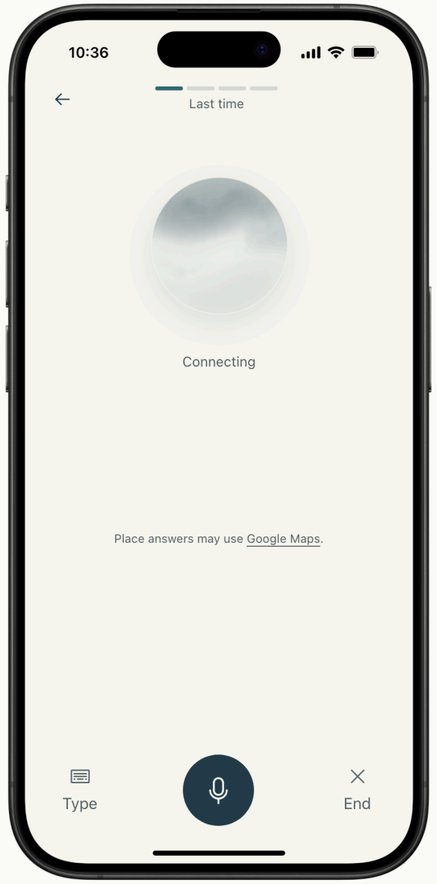


More Signals

Places, Your day and Check-ins groups.

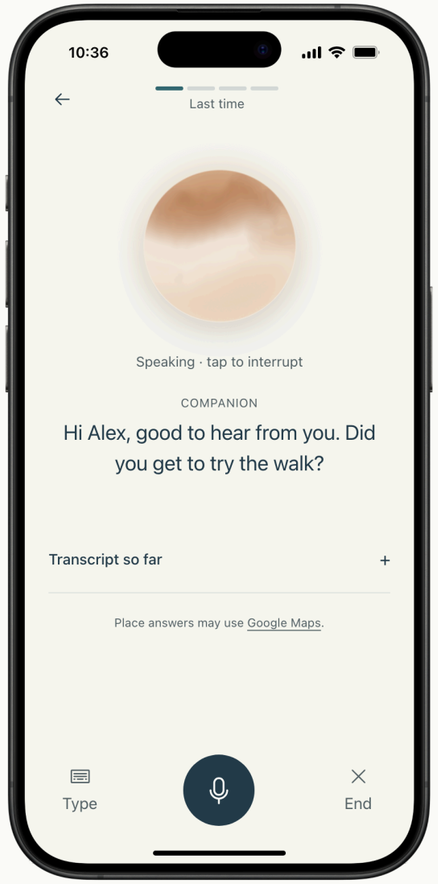
Voice Check-in · Gemini Live

A real-time voice session. The orb is the only focal point; its colour shows who is talking and its size follows the audio. The live caption is always on.



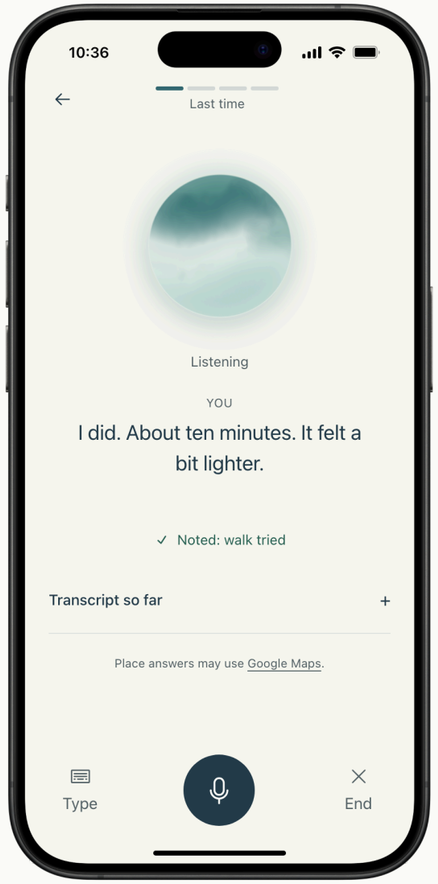
Connecting

Short-lived token, then setupComplete.



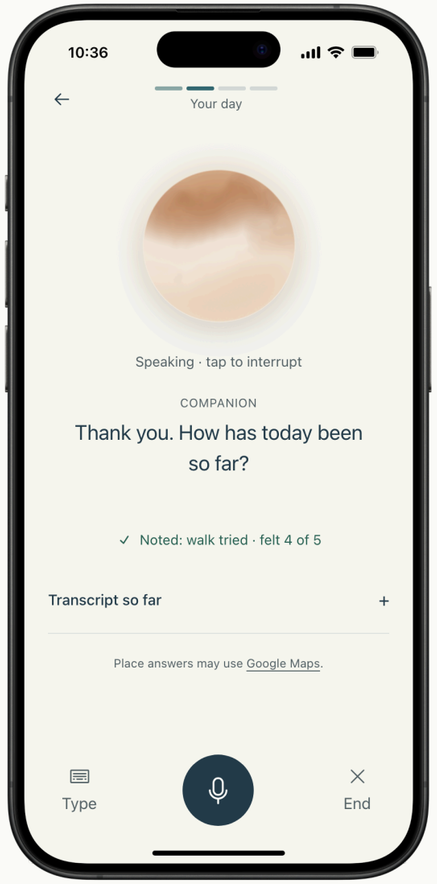
Companion speaking

Words appear as the transcript streams. Tap the orb to interrupt.



Listening

The orb follows the microphone level.

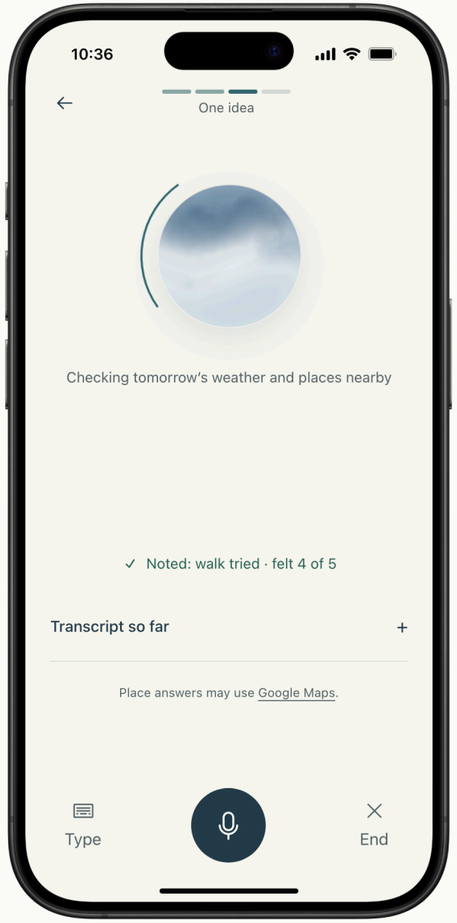


Outcome noted

What the Companion records is shown plainly.

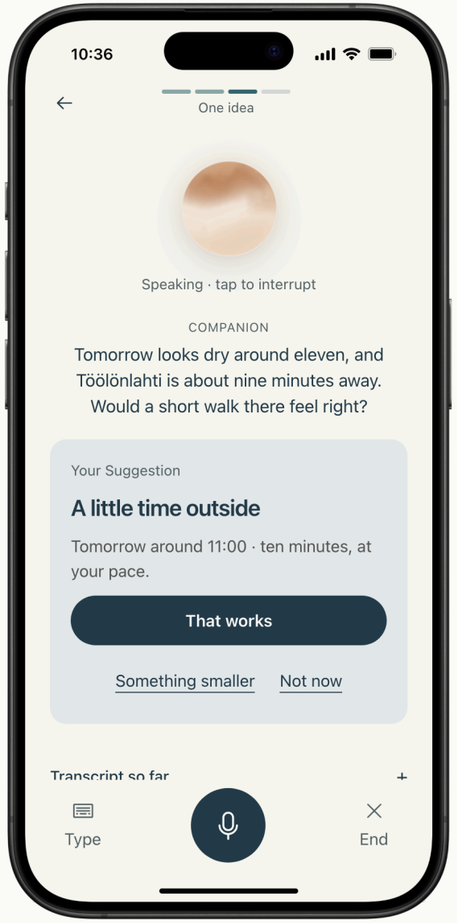
Voice Check-in · one idea

Tool calls run quietly, then one Suggestion arrives as a card the Patient can accept by voice or touch.



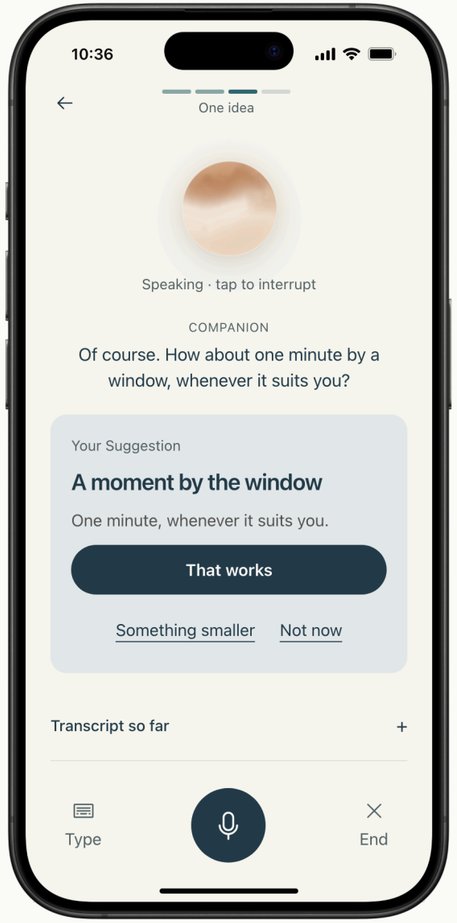
Looking something up

Weather and places tool call.



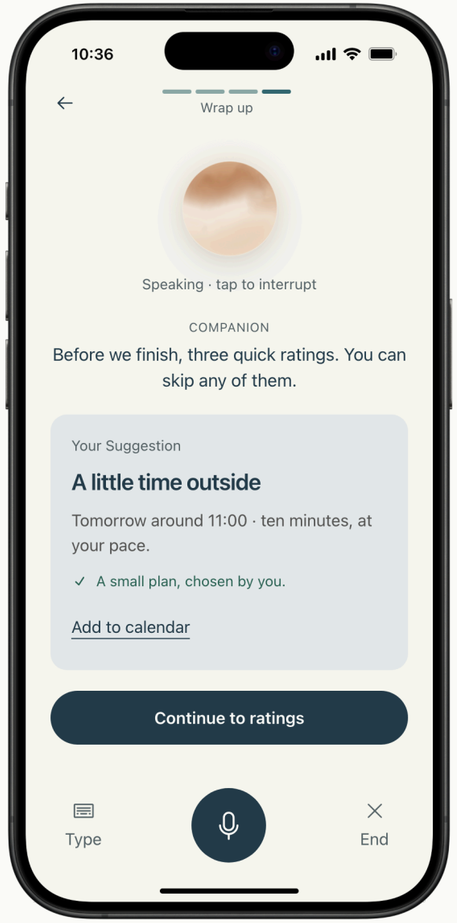
One Suggestion

That works · Something smaller · Not now.



Something smaller

The proposal shrinks; no pressure.

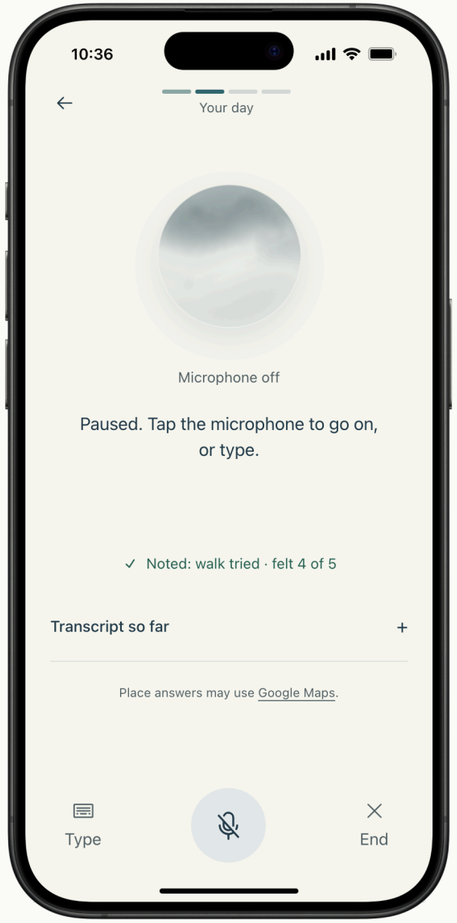


Chosen

Optional calendar booking, then wrap up.

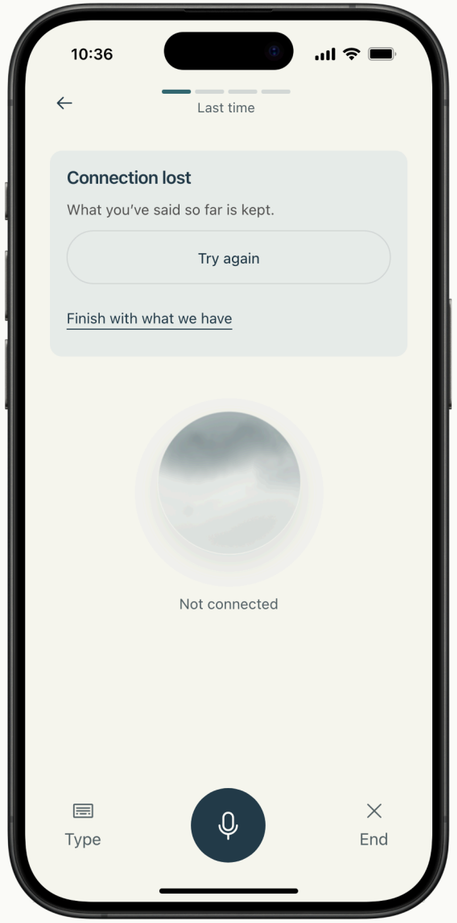
Voice Check-in · interruptions

Every break in the session keeps what was said and offers one calm way on.



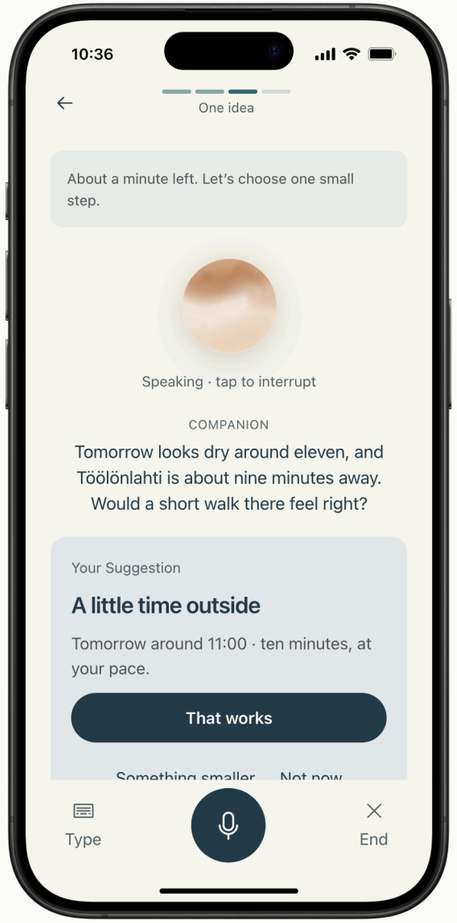
Microphone off

Paused orb; typing stays one tap away.



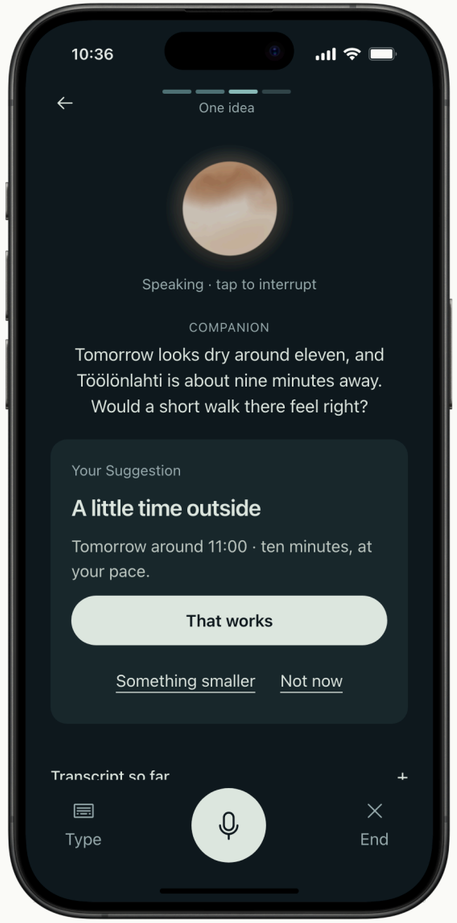
Connection lost

Retry, or finish with what we have.



Near the time limit

Target 3 minutes, cap about 8.

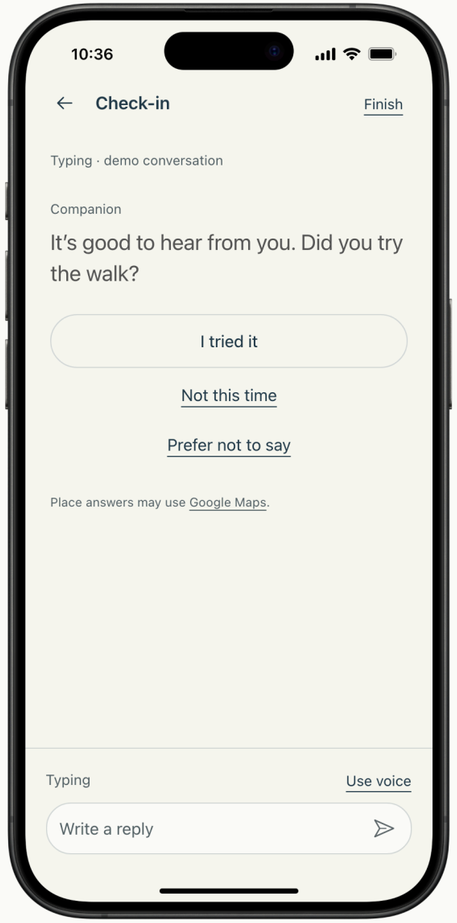


Voice at night

Same session in the night theme.

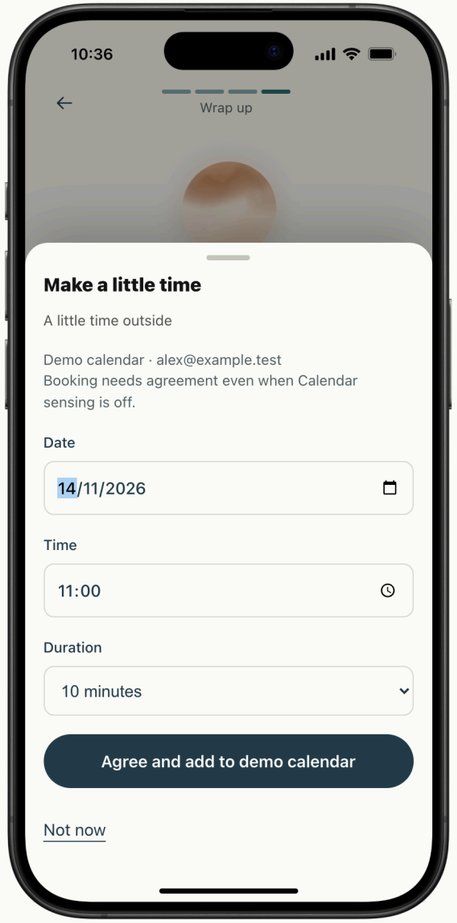
Typed, booking and pauses

The same conversation by text, an explicit agreement before anything reaches the calendar, and a calm pause.



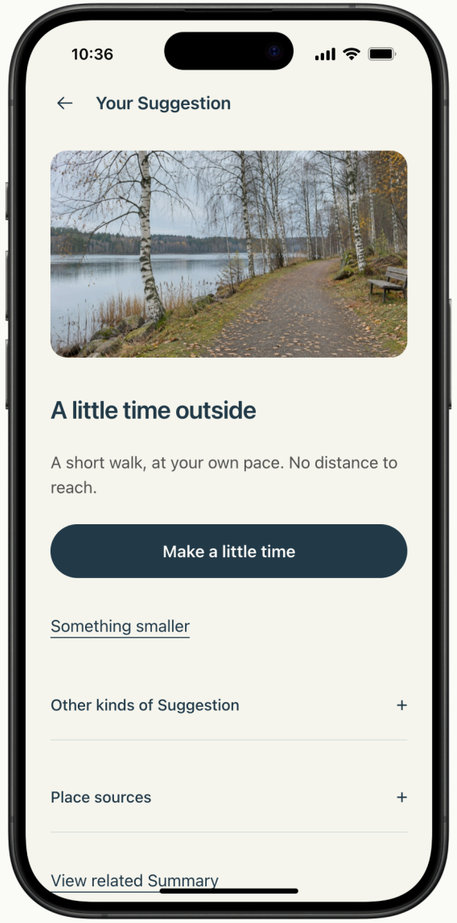
Typed Check-in

Transcript with gentle answer choices.



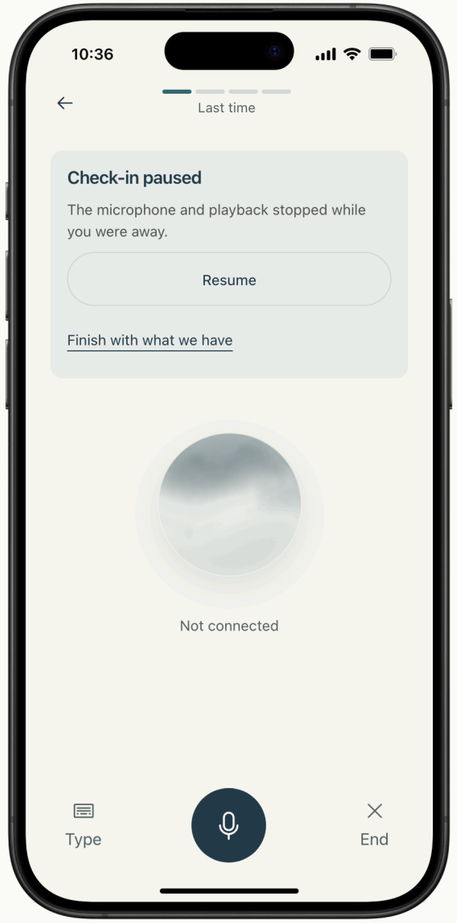
Add to calendar

Date, time and duration, validated.



Suggestion detail

Place sources from Google Maps.

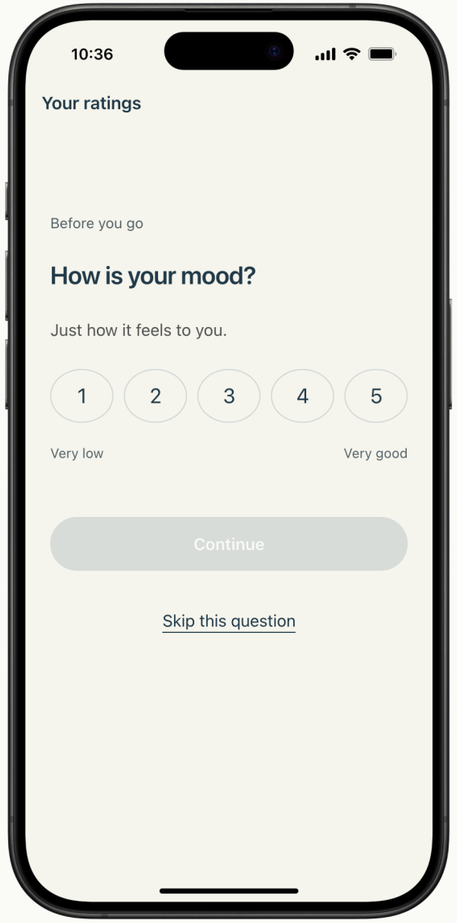


Check-in paused

After a call or app switch; resume when ready.

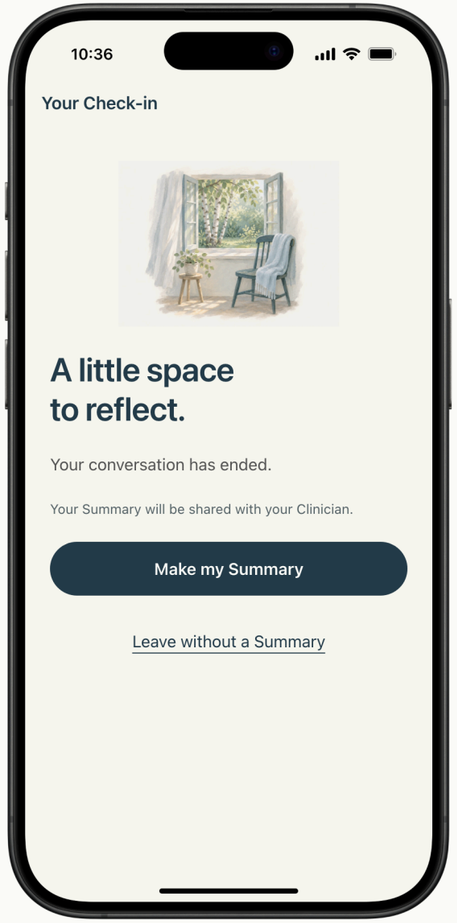
Finishing and Summary

Three optional ratings, then the same Summary the Clinician reads.



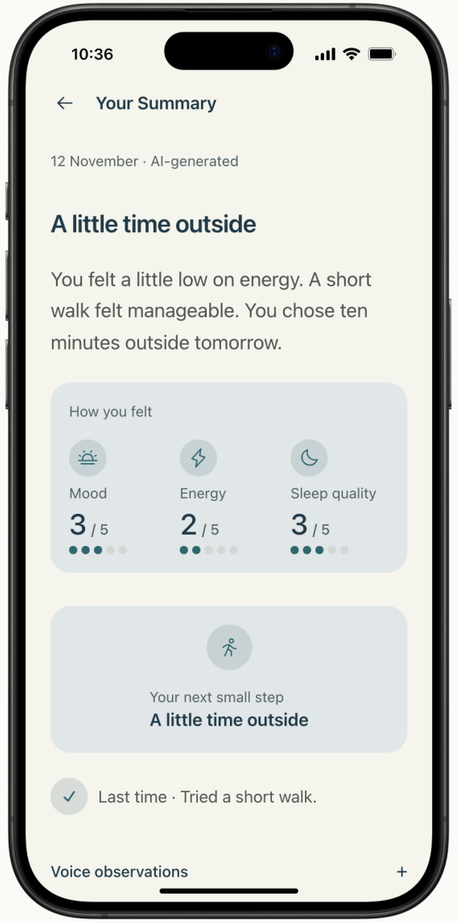
Ratings

Skip is always there; skipped stays unanswered.



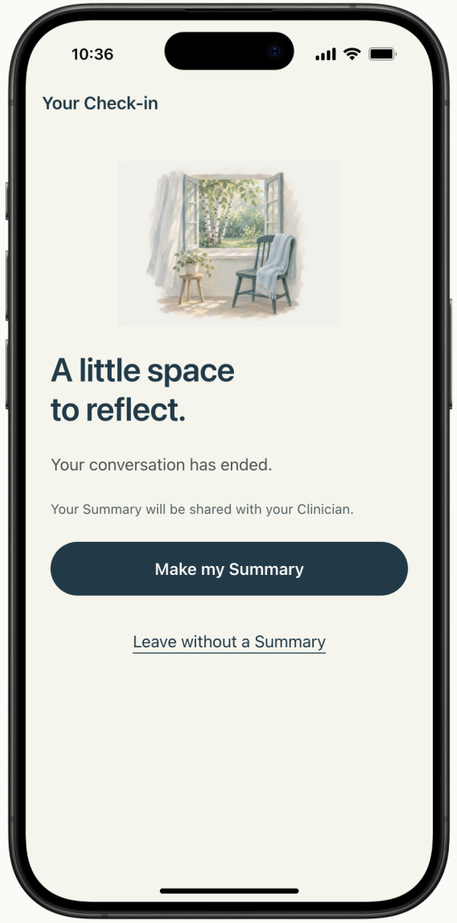
Making the Summary

Leave without a Summary is possible.



Summary

How you felt, the next small step, no transcript.

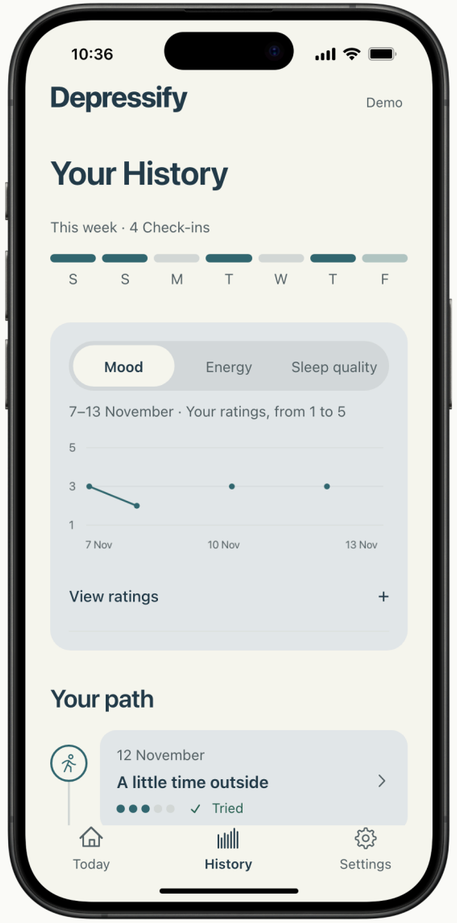


Summary failure

Never invents success.

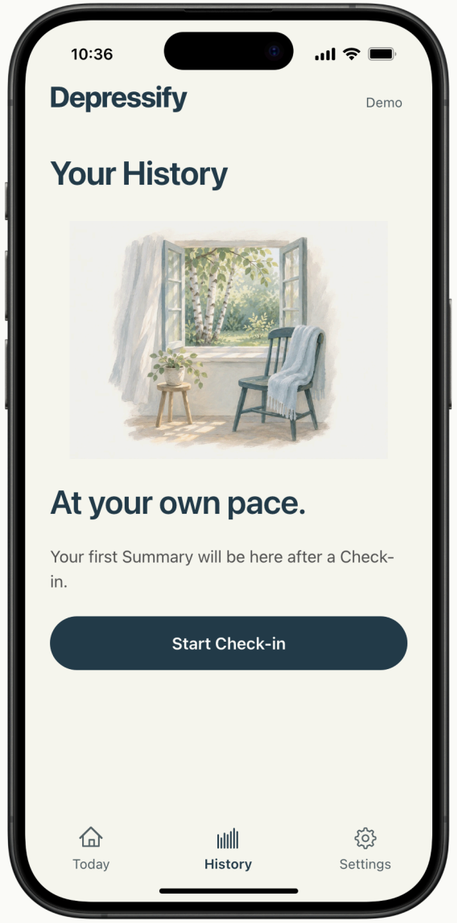
History

A calm record. Missing days are gaps, never zero.



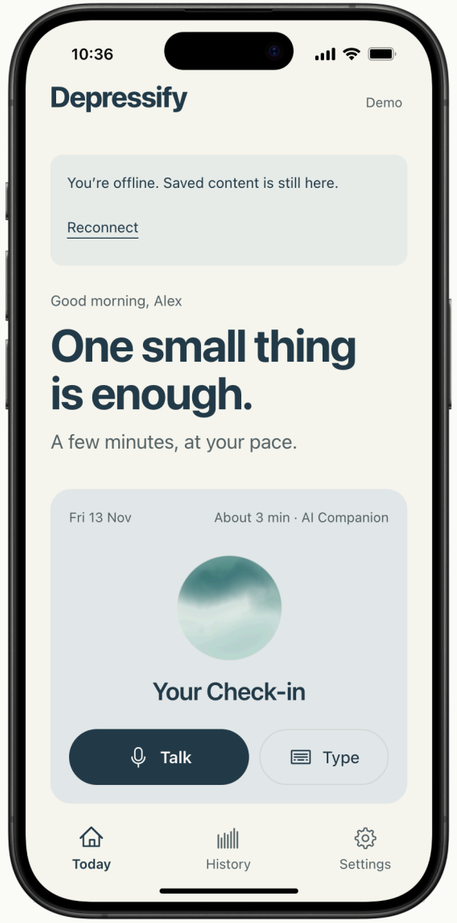
History

Week row, trend card and the path of Check-ins.



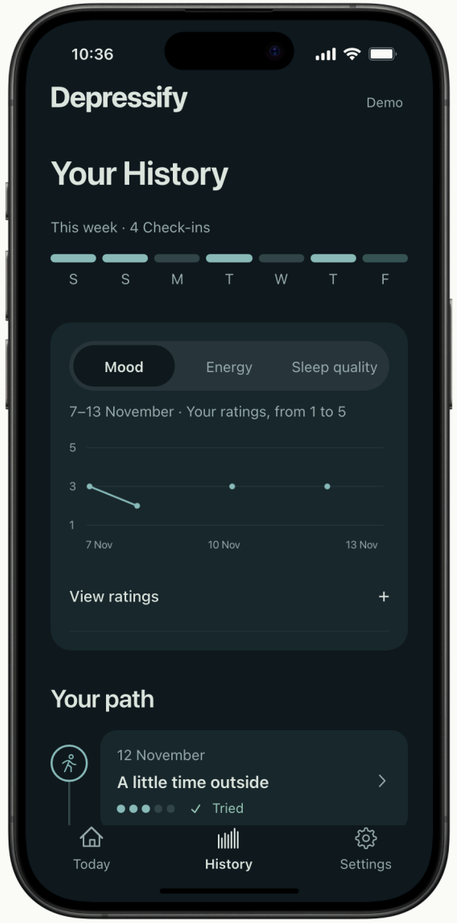
No history

Illustration and one action.



Offline

Saved content stays readable.

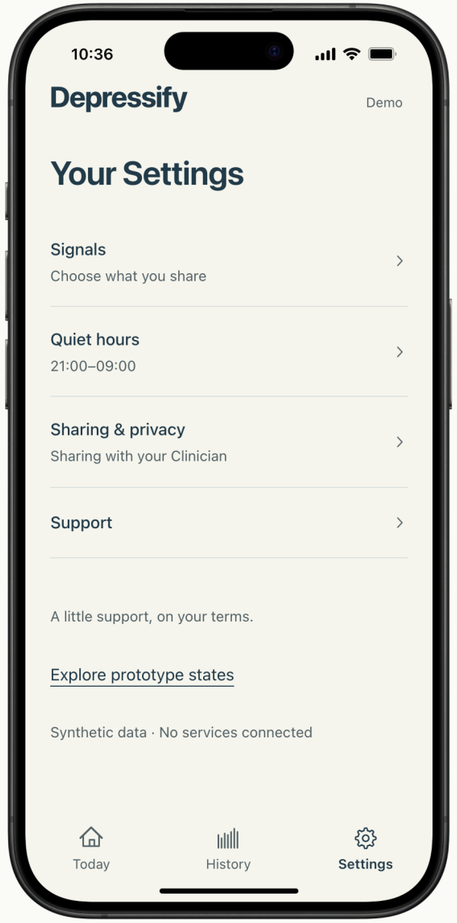


History at night

Chart colours follow the theme.

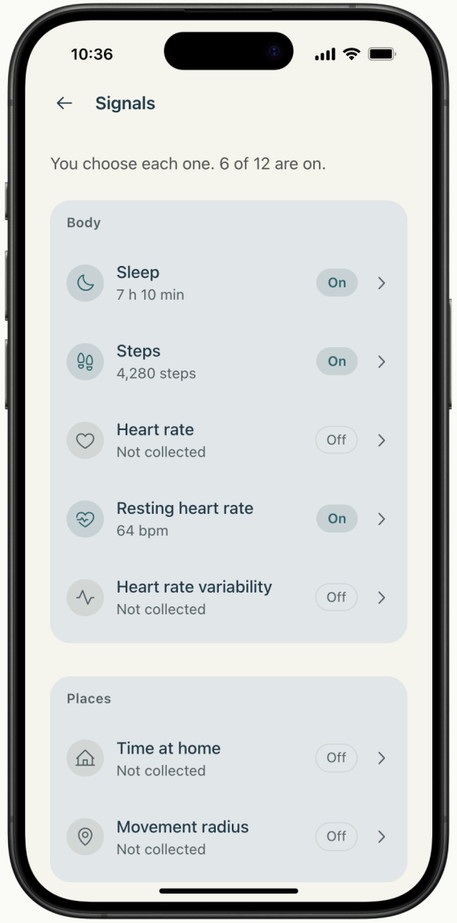
Settings and Consent

Each Signal has its own Consent, and stopping deletes what was collected.



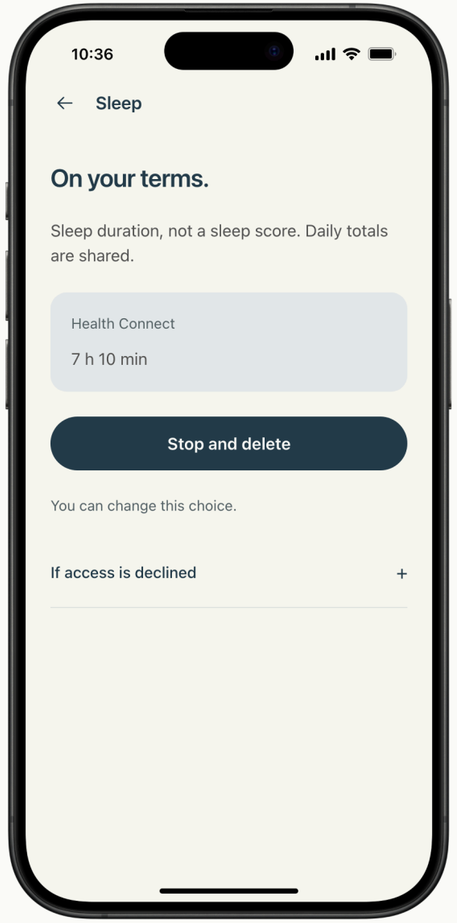
Settings

Four plain rows.



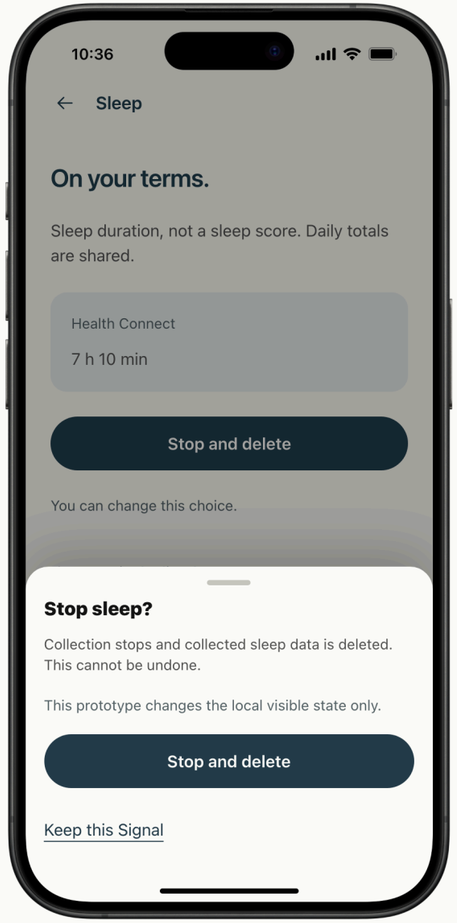
Signals

Grouped cards with icon, value and On or Off.



Signal detail

Why it helps and where it comes from.

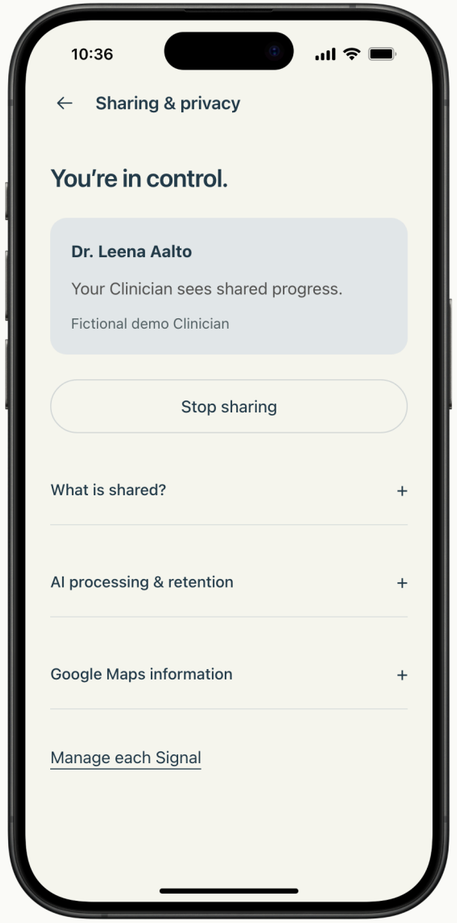


Stop and delete

States plainly that it cannot be undone.

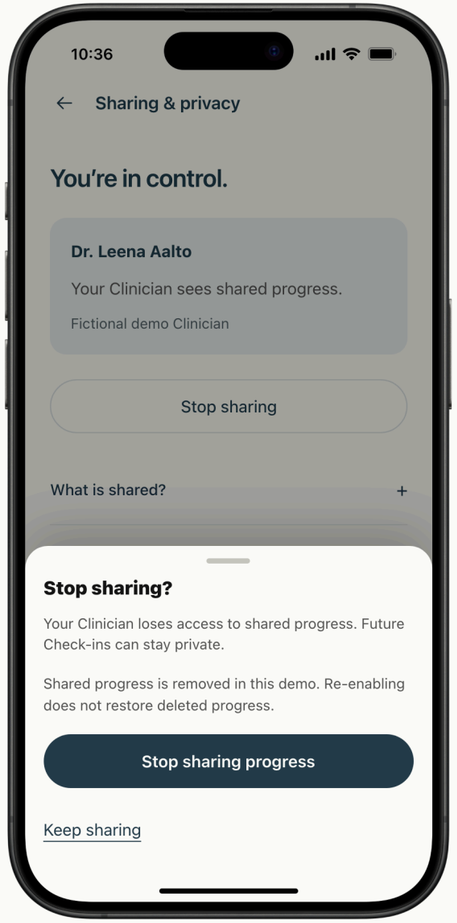
Privacy, quiet hours and support

Sharing can be withdrawn at any time. Help is human and the app never dials.



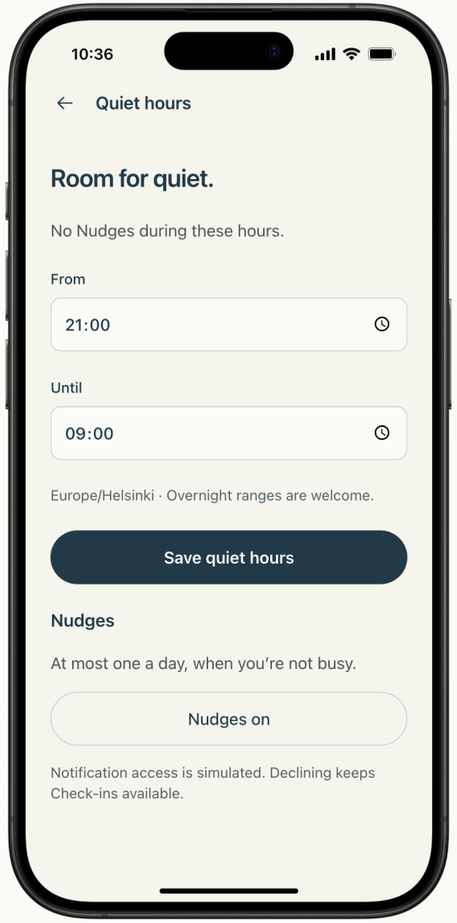
Sharing and privacy

AI processing and retention, in plain words.



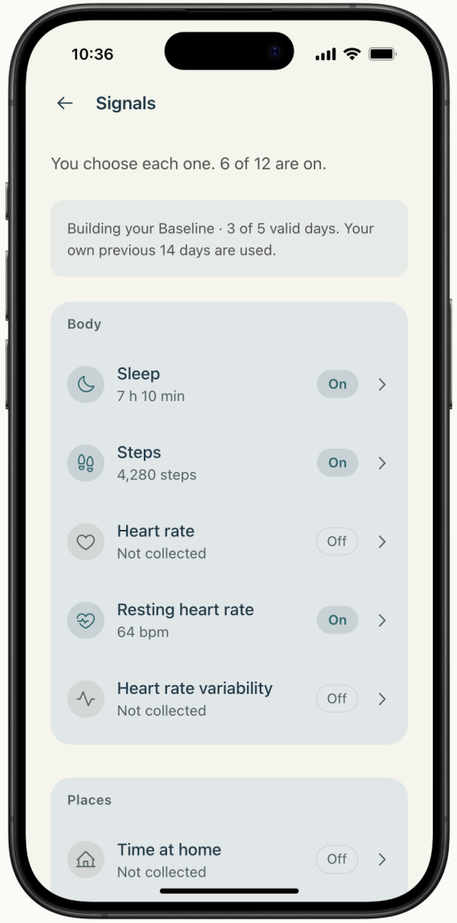
Stop sharing

Explains what the Clinician loses.



Quiet hours

No Nudges overnight.

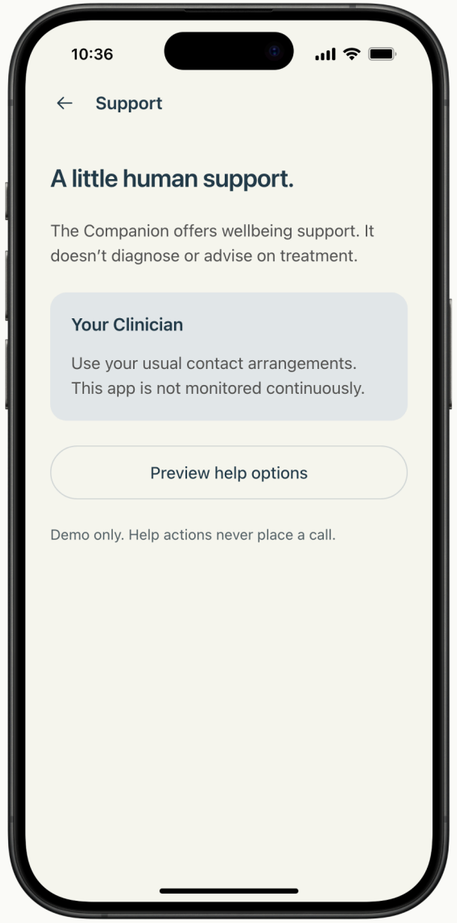


Building a Baseline

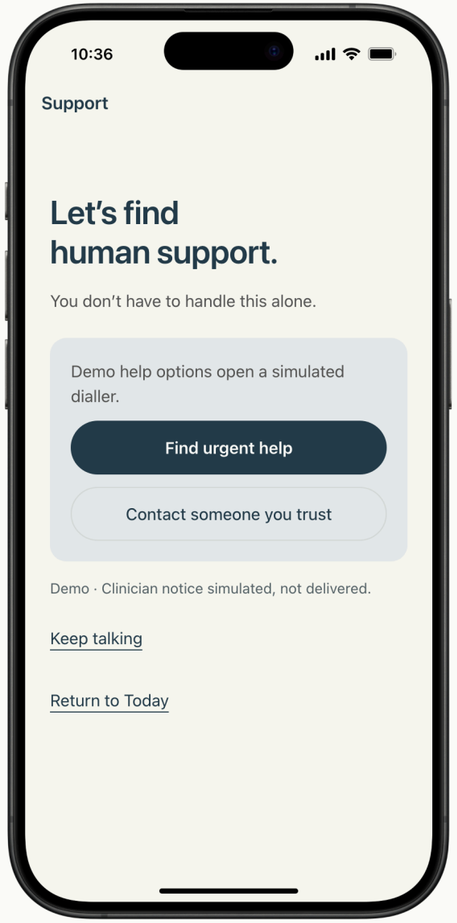
Five valid days before comparisons.

Crisis

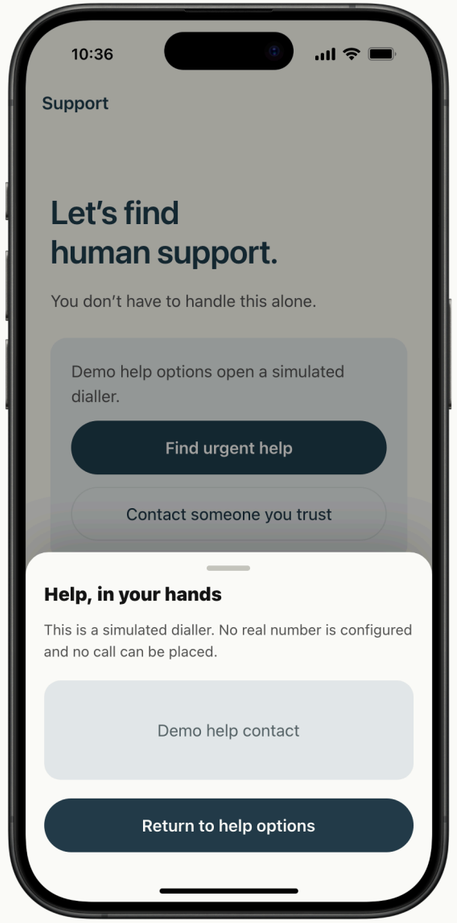
Appears before any network call. The Patient places the call; the app never does.



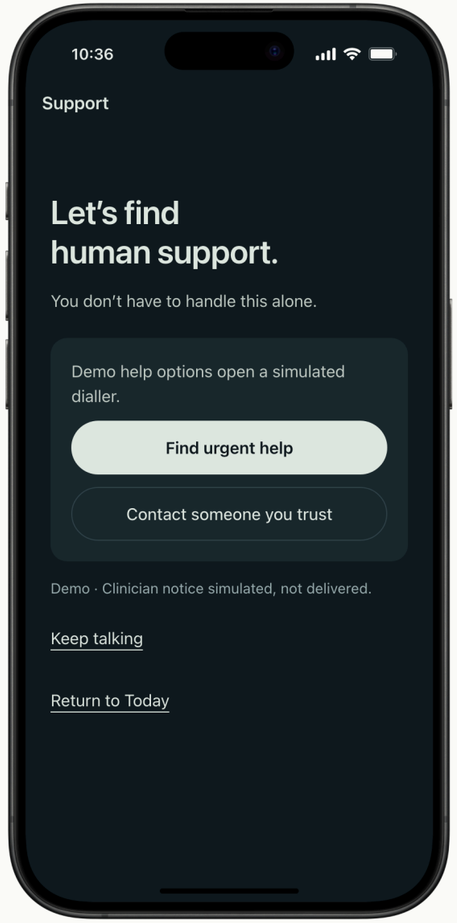
Support
The Companion is not monitored continuously.



Crisis notice
Two human options and a quiet way back.



Simulated dialler
Demo number only.



Crisis at night
Same calm layout, dark.

Voice session states

Each state maps to an event in the Gemini Live API. The orb changes colour on every state, including under Reduce Motion, where its size stays still.

State	Live API event	What the Patient sees
Connecting	Ephemeral token, setupComplete	Still orb, “Connecting”
Speaking	Model audio + outputTranscription	Warm orb sized by output level; caption streams word by word
Listening	Mic stream + inputTranscription	Teal orb sized by mic level; caption under “You”
One moment	toolCall (weather, places, calendar, health)	Blue orb with a thin arc; the tool is named
Interrupted	serverContent.interrupted	Playback stops at once; back to listening
Microphone off	audioStreamEnd	Grey orb; typing offered
Connection lost	Socket closed	Retry, or finish with what we have
Wrap up	Client timer: target 3 min, cap ~8	One line, then ratings
Crisis	Raise-crisis tool	Crisis notice before any network call

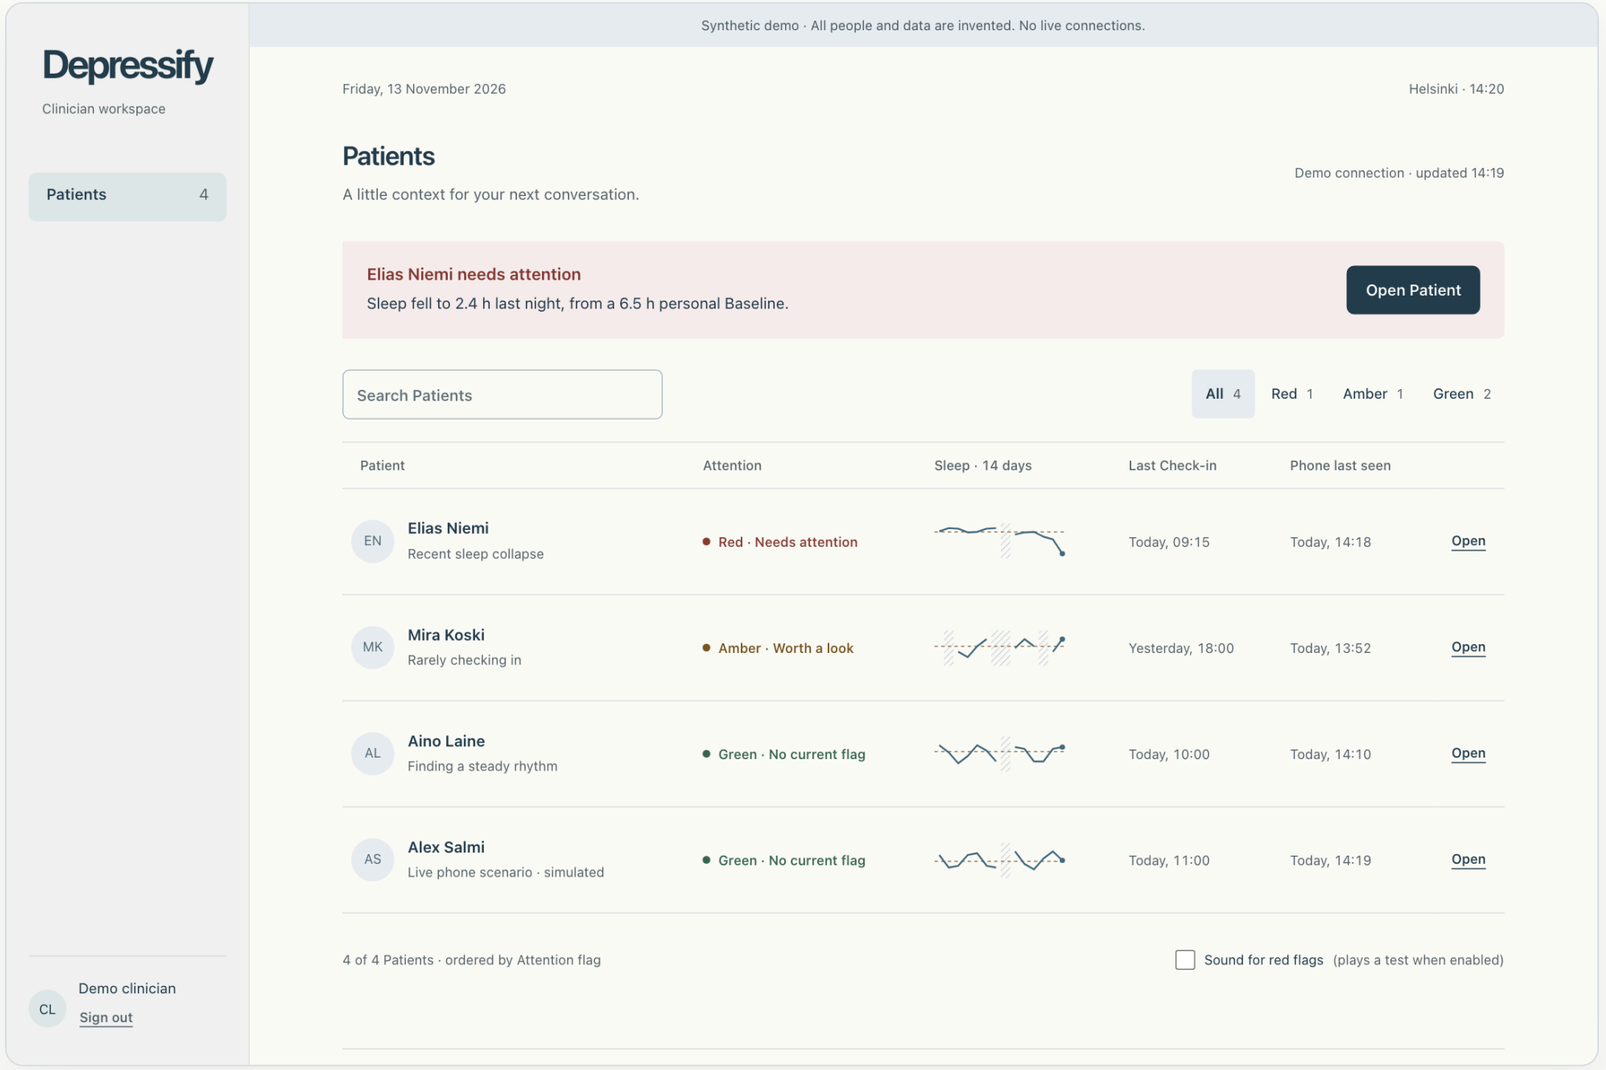
PART 2

Clinician dashboard

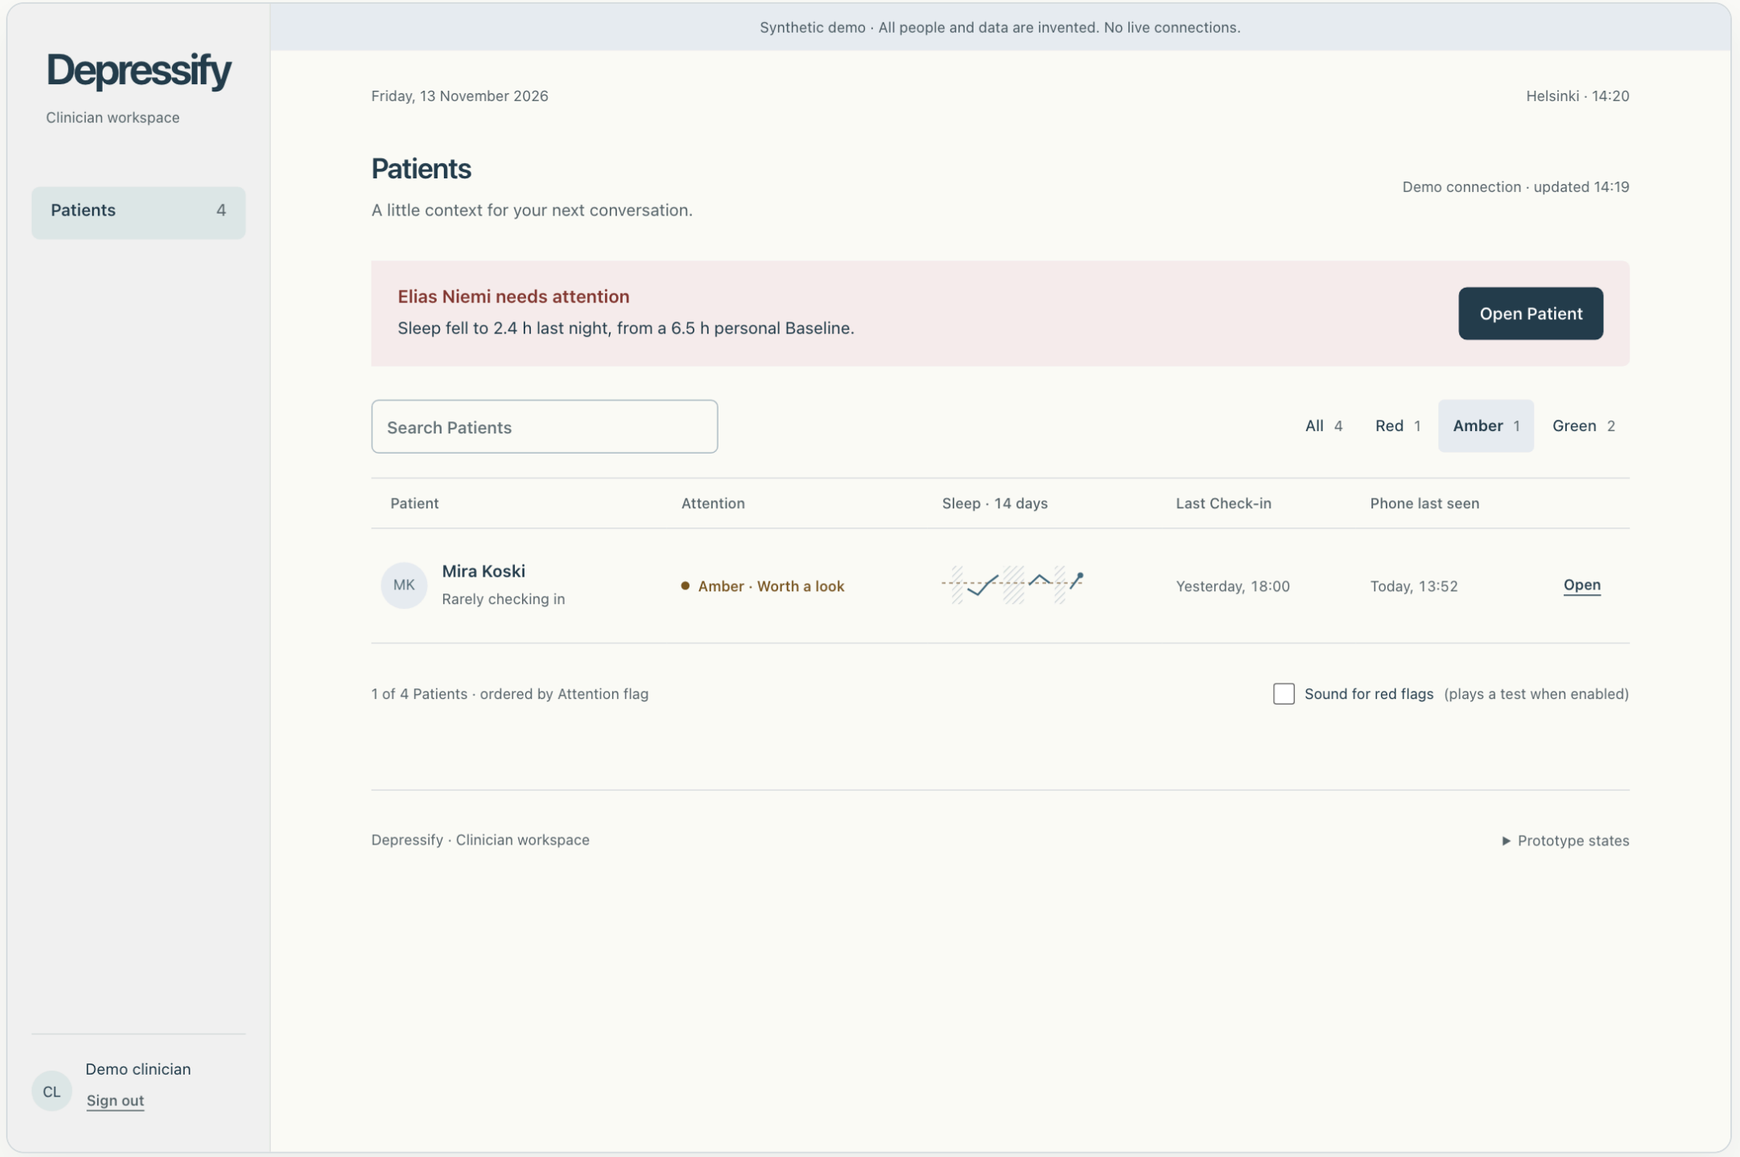
Desktop 1440, with tablet and phone layouts. Same Summary as the Patient; never transcripts or audio.

Patients · Patient list with a red flag

People and reasons first. Red, then amber, then green. Each row shows the last 14 nights of sleep against the Patient's own Baseline, with hatched days where there is no data.

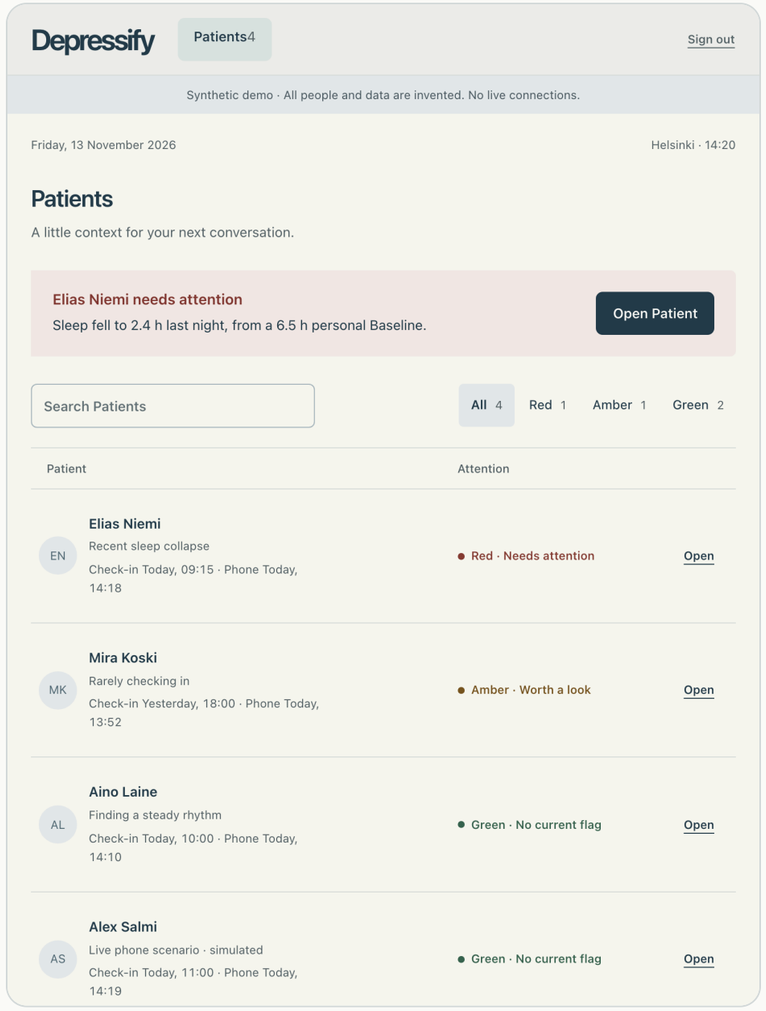


Patients · Filtered to amber

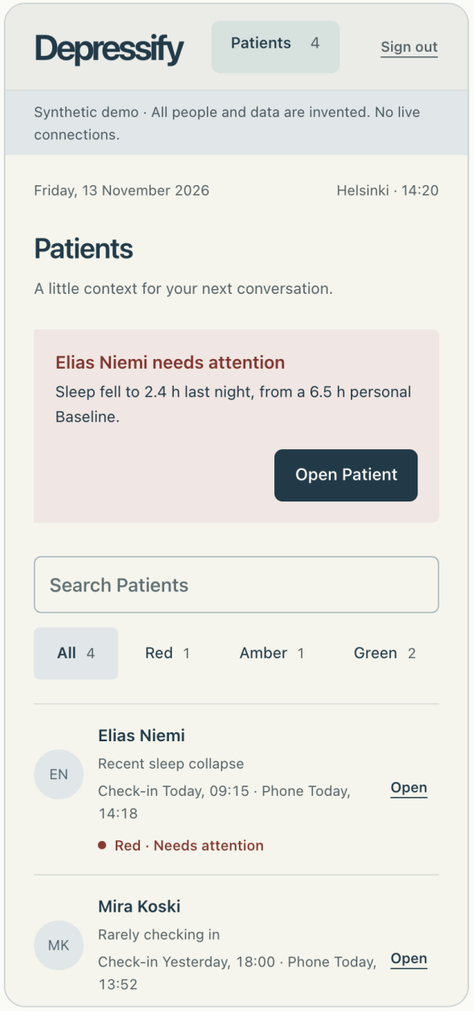


Patients · smaller screens

The sidebar folds; freshness moves into each row.



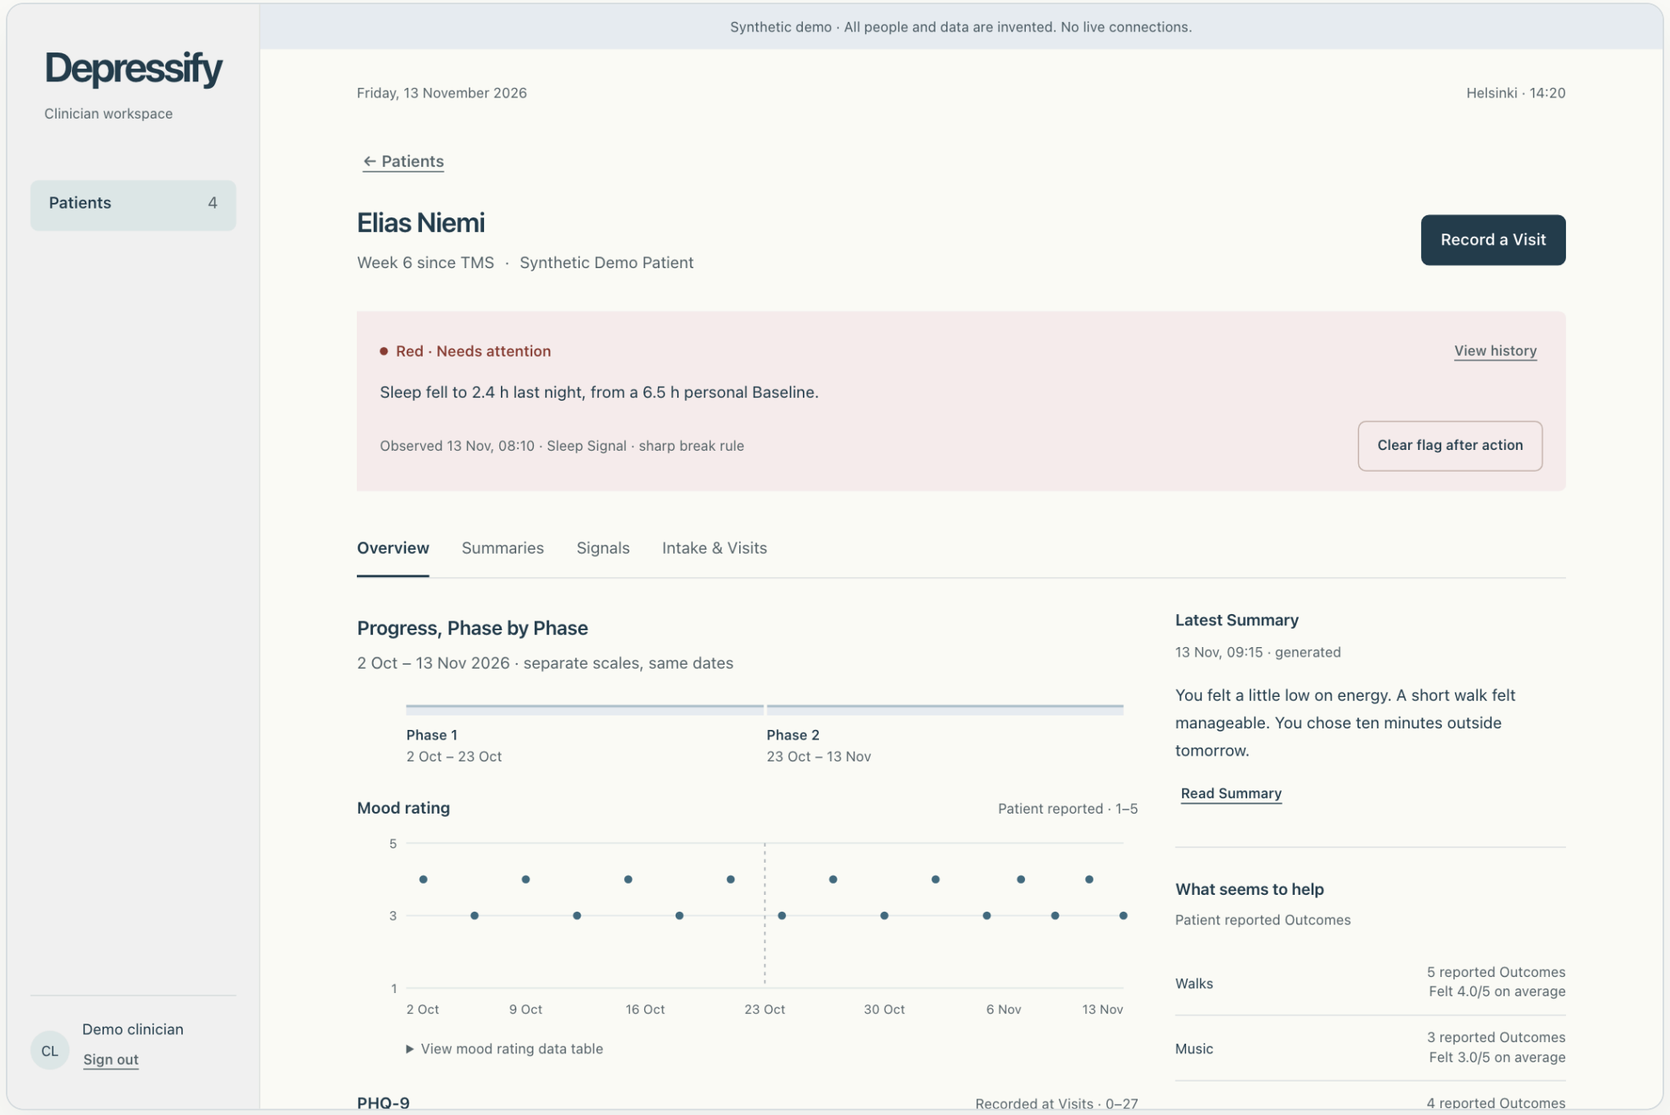
Tablet · 768



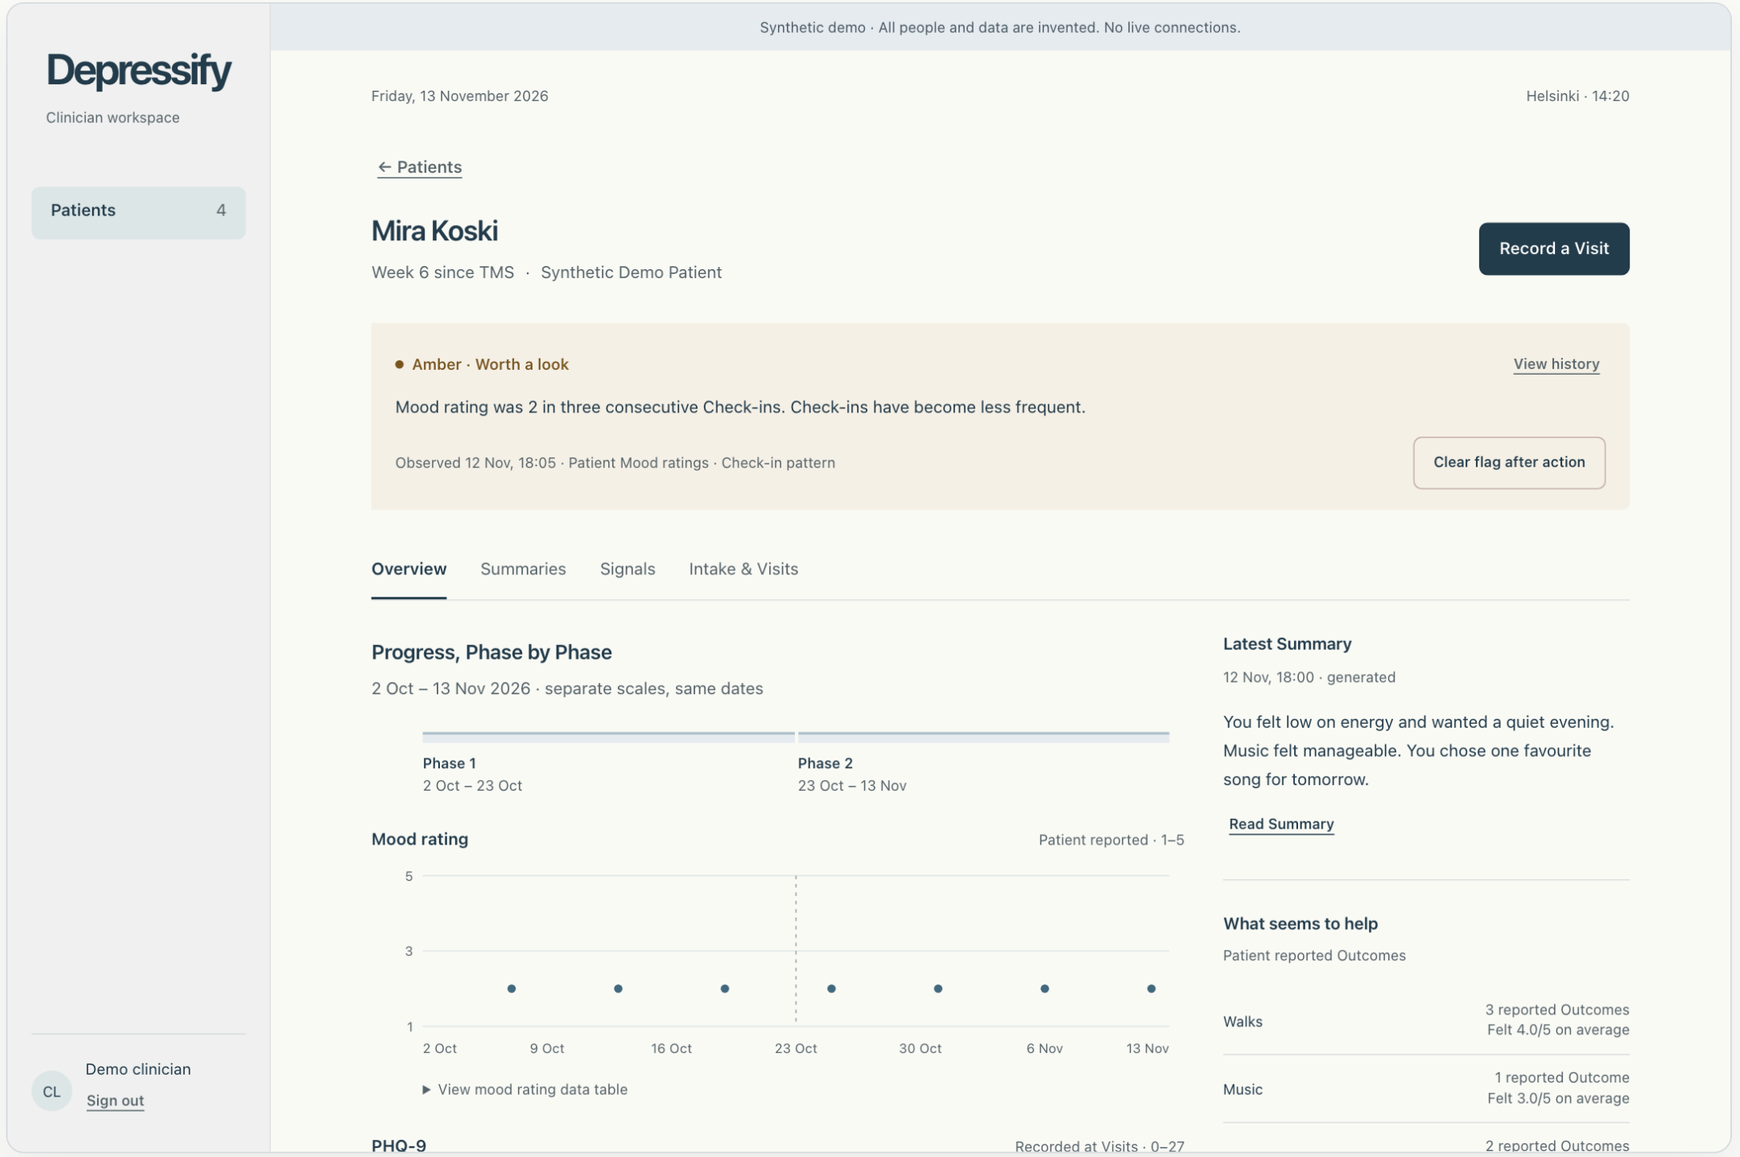
Phone · 390

Patient · Overview · red flag

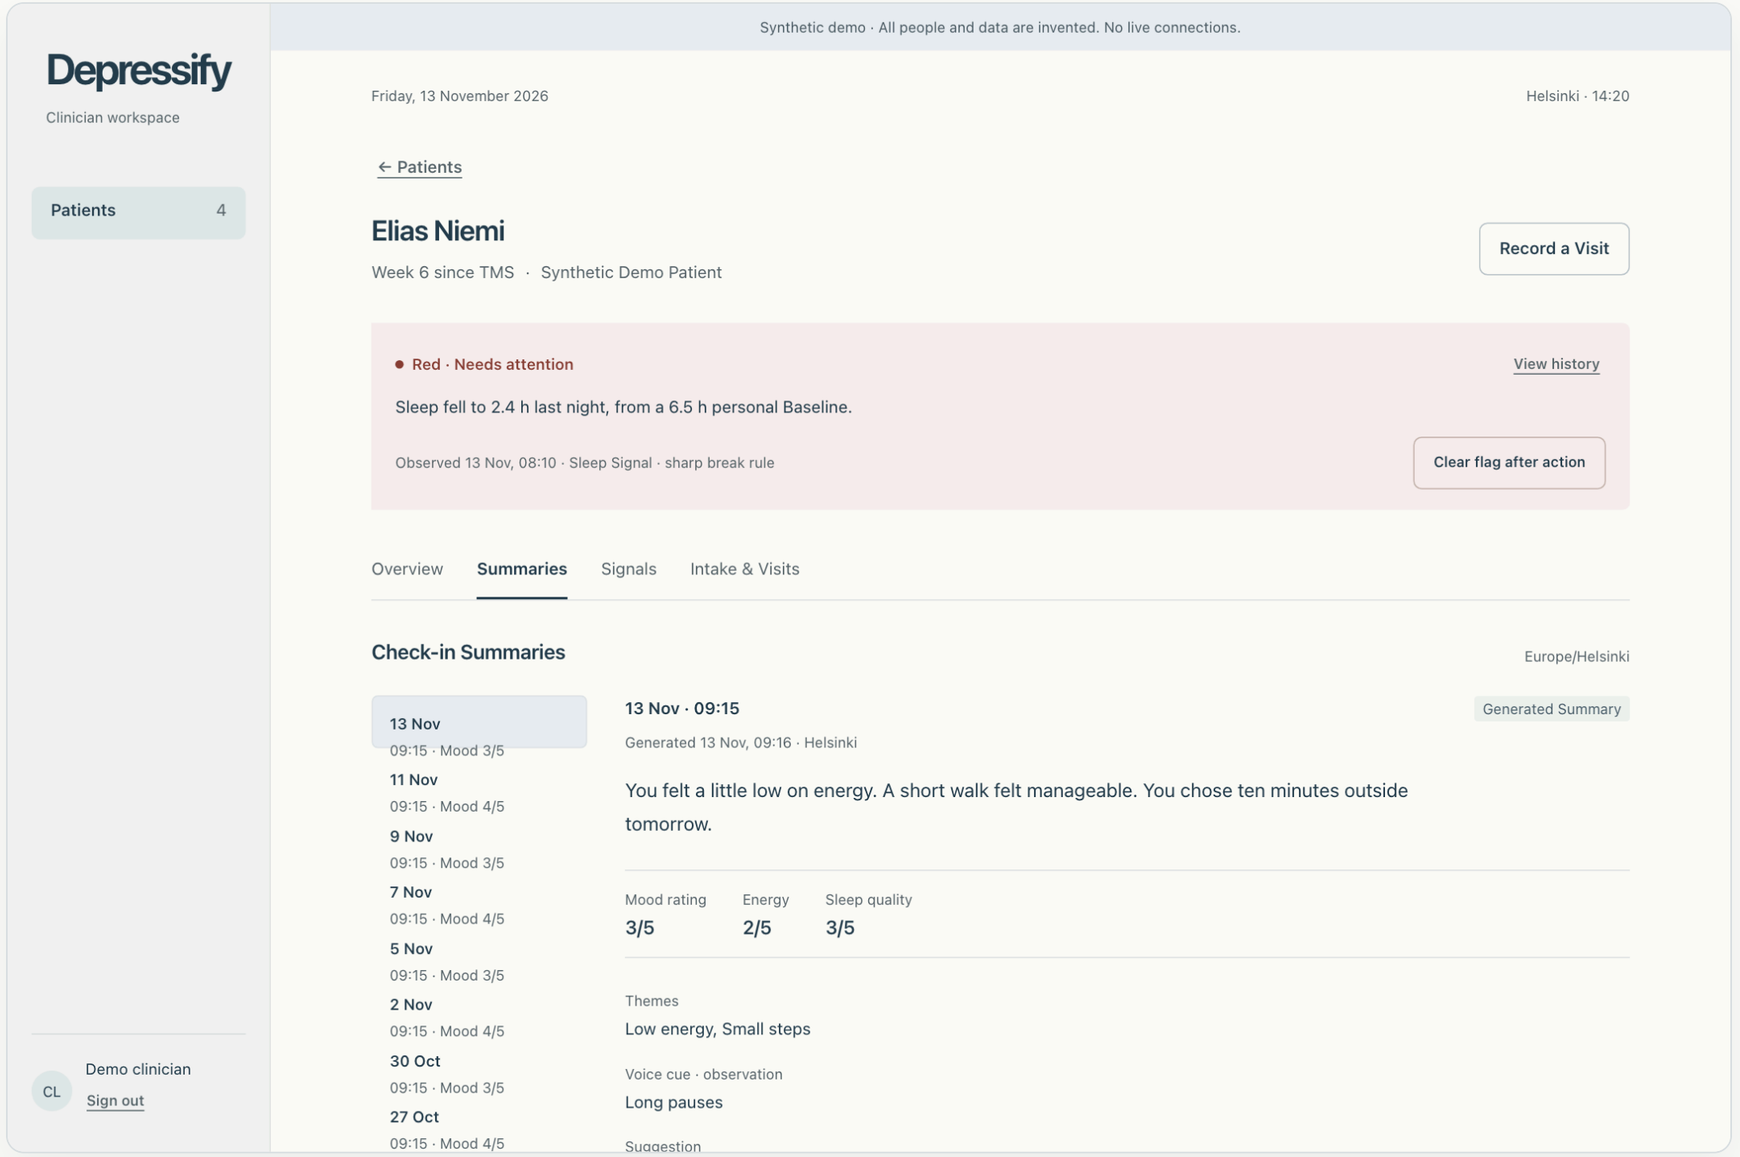
One Patient, four views. The flag explains itself with its source and time.



Patient · Overview · amber flag



Patient · Summaries and Digest



Patient · Signals against Baseline

Synthetic demo · All people and data are invented. No live connections.

Decisions from the Claude Design artifacts

Two artifact boards (patient flow and clinician dashboard) were reviewed against the requirements.

Idea	Decision
Voice orb with a live caption and step marker	Adopted, with an always-on caption (no captions toggle)
Time-of-day greeting and a night theme	Adopted
14-day sleep sparkline with hatched missing days	Adopted in the list and the Signal charts
Crisis and No data as extra flag levels	Not adopted: three flag levels (ADR 0009)
BDI and HAM-D discharge scores	Not adopted: PHQ-2 and PHQ-9 at Visits
Export report and Log a call	Not adopted: not in the requirements
Voice-feature charts (pitch, pace, pauses)	Not adopted: on-phone voice analysis is a stretch goal
Microphone permission during onboarding	Not adopted: asked at first Check-in, with typing as the fallback
Did the walk help? on Today	Not adopted: the Outcome is asked in the next Check-in

Today · first target and current build

The first Small Step target on the left, the current Today screen on the right. After review the build moved to health-style cards: a Check-in card with the date, a week row and a places map.
